This document records the FoodSaver AI website pages implemented up to Milestone 1. Each section presents an original, unaltered screenshot with a short description of what is visible. The screenshots contain demonstration records labelled [Demo].

No separate screenshot of applied search or filter results was supplied, so Image 08 identifies the filter controls as they appear on the dashboard (the same screenshot as Image 04).

Image 01 — User Login Page

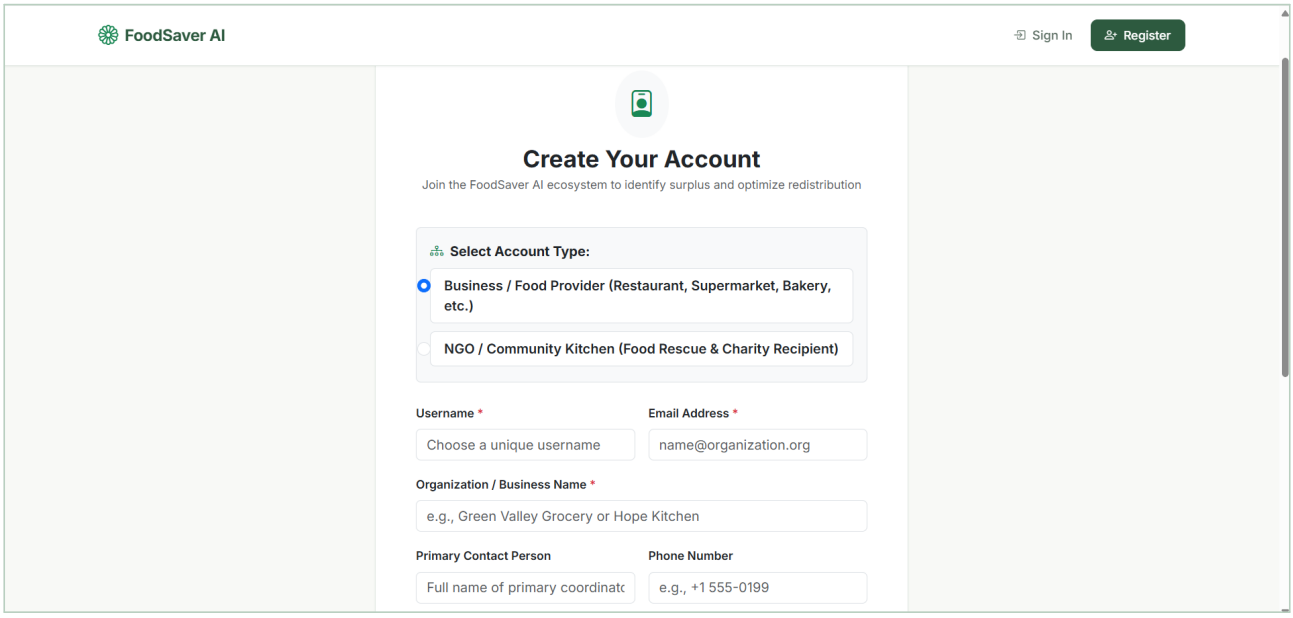

The Sign In page lets registered users enter their username and password to access their surplus inventory or NGO rescue dashboard. It also provides a link to register as a business or NGO, with Sign In and Register options in the header for new users.

REGISTRATION WORKFLOW: PART 1 OF 2 (CONTINUES IN IMAGE 03)

Image 02 — User Registration Page (Part 1)

The first part of the Create Your Account form asks the user to select an account type, either Business / Food Provider or NGO / Community Kitchen. It then collects the username, email address, organization or business name, primary contact person and phone number.

REGISTRATION WORKFLOW: PART 2 OF 2 (CONTINUES FROM IMAGE 02)

Image 03 — User Registration Page (Part 2)

The second part of the form continues with an address or operational area field, followed by password and confirm password fields for the new account. A Register Account button is provided to complete registration, along with a Sign In link for users who already have an account.

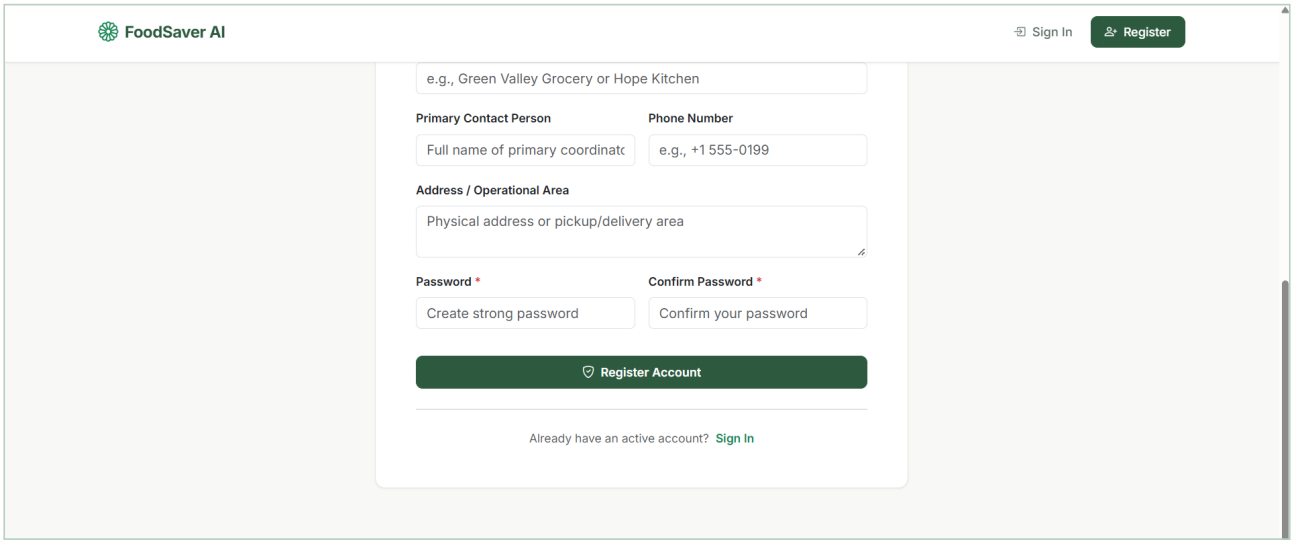

Image 04 — Business Inventory Dashboard

The Surplus Food Inventory dashboard for the logged-in food provider shows a high spoilage risk alert reporting 2 critical items and 13 expired items, with buttons to view each group. Summary cards display a total stock of 20 active items alongside 2 critical, 2 medium and 3 low-risk items, above the search controls and the start of the inventory records table.

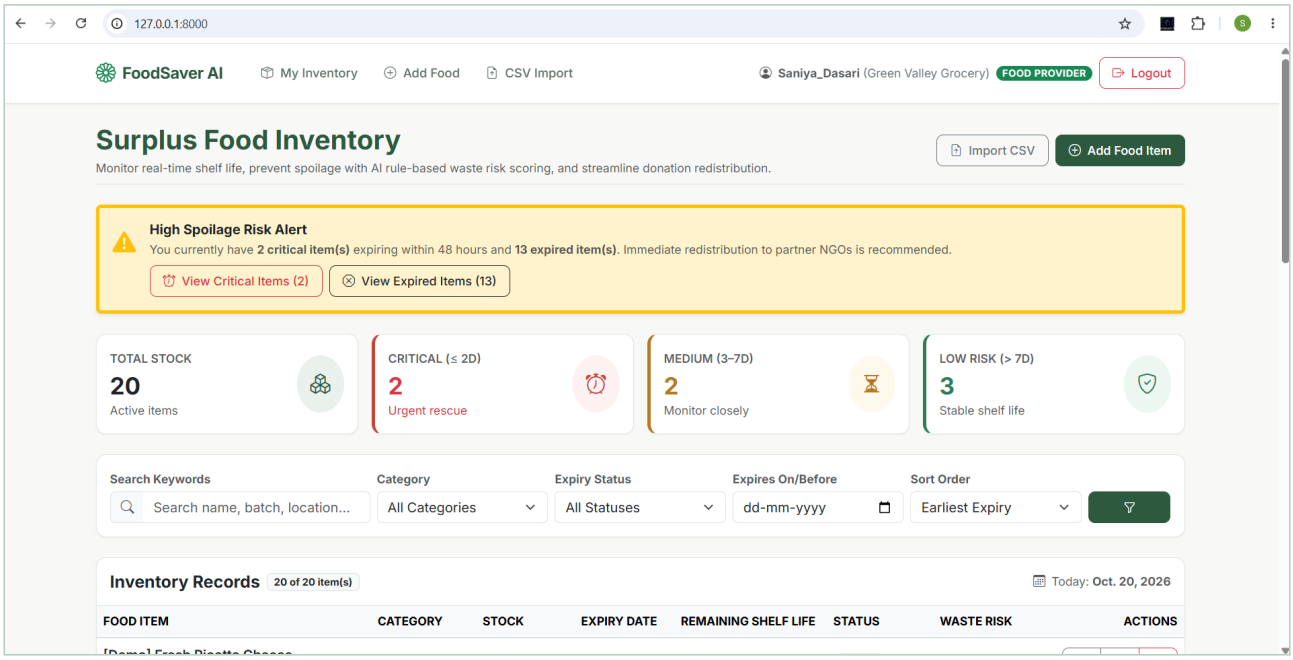

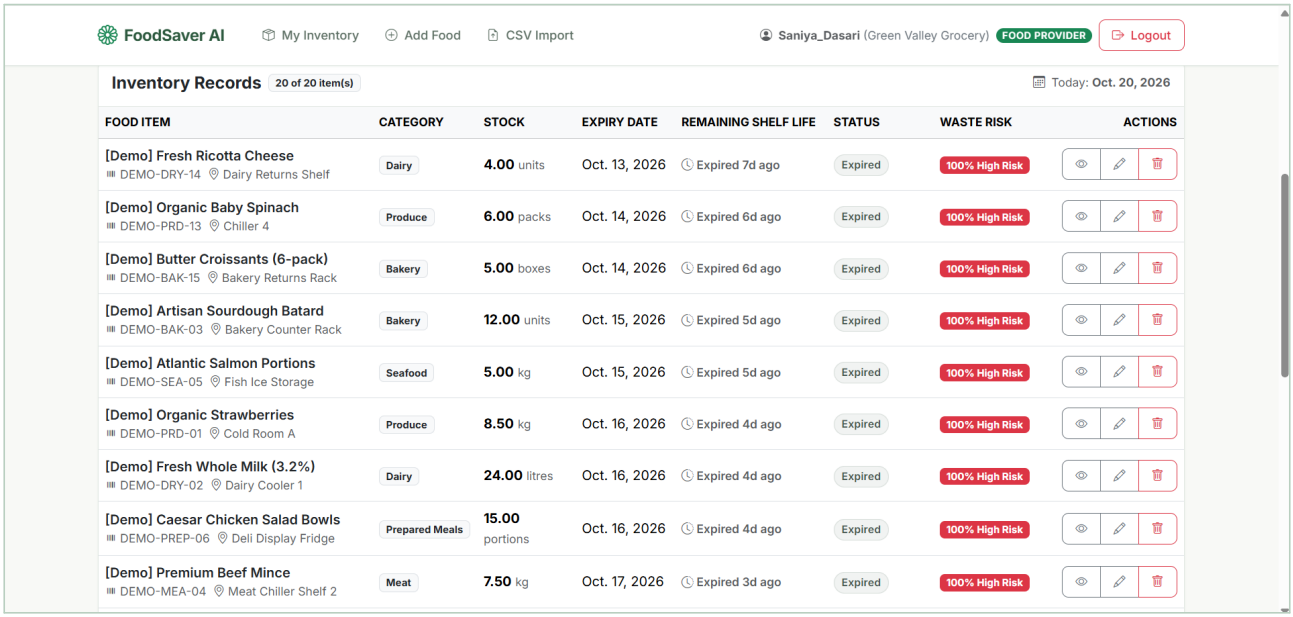

Image 05 — Food Inventory Records

The Inventory Records table lists each food item with its category, stock quantity and unit, expiry date, remaining shelf life, status and waste risk, together with its batch code and storage location. In the visible rows every item is marked Expired with a 100% High Risk label, and each row offers view, edit and delete action buttons.

FOOD INVENTORY RECORDS AND DETAILS (CONTINUED FROM IMAGE 05)

Image 06 — Food Item Details

The item detail page for one demonstration record shows its category, expiry status, batch or lot number, stock quantity, expiry date and a waste risk assessment of 100% (High Risk) described as an AI rule-based loss probability. It also displays the storage location, provider or donor details, description notes, and logged, last updated and owner information, with Edit Item and Delete buttons.

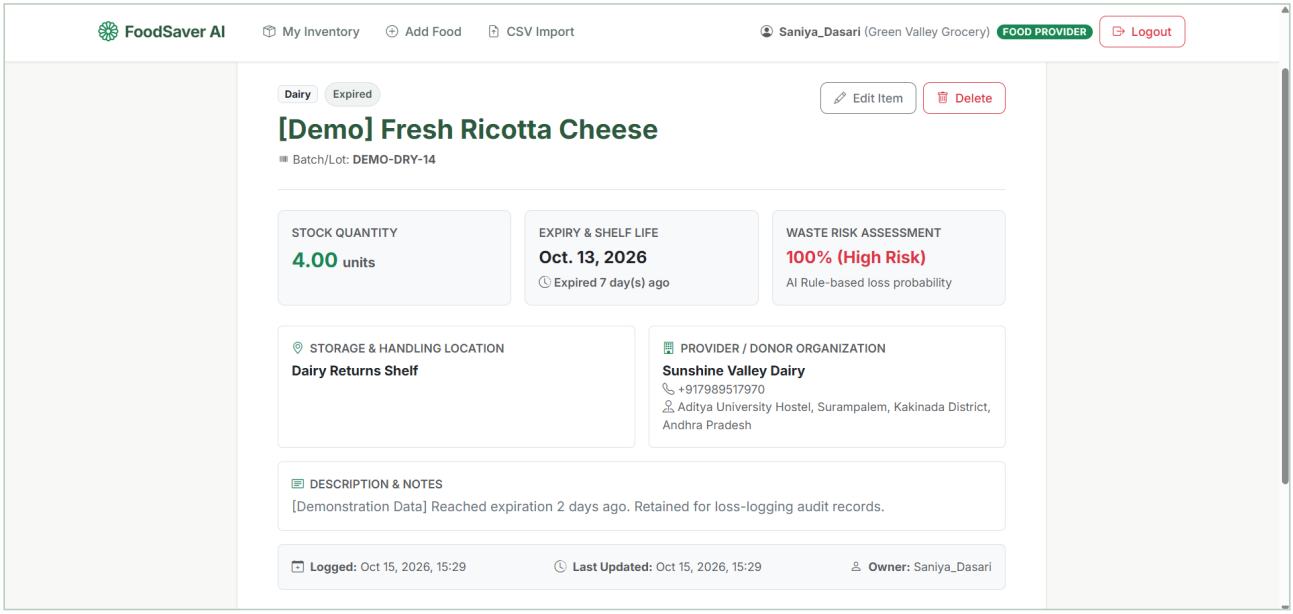

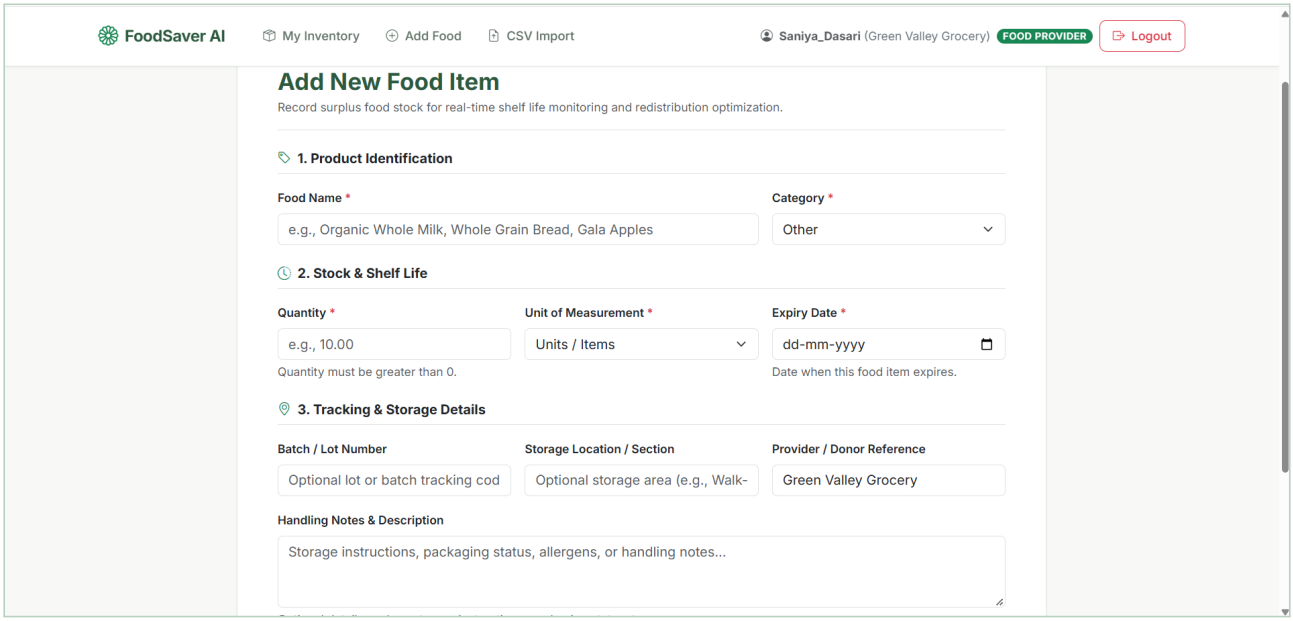

Image 07 — Add Food Item Page

The Add New Food Item form is organised into Product Identification, Stock and Shelf Life, and Tracking and Storage Details sections, with required fields marked for food name, category, quantity, unit and expiry date. Optional batch or lot number, storage location, provider or donor reference and handling notes fields are also provided, and a hint states that the quantity must be greater than 0.

EVIDENCE NOTE: THE FILTER PANEL IS SHOWN IN THE SAME DASHBOARD SCREENSHOT AS IMAGE 04

Image 08 — Search and Filtering

The filter panel provides a keyword search box for name, batch or location, together with Category, Expiry Status, Expires On/Before and Sort Order controls, which appear here with their default values. These controls and the filter button beside them allow users to narrow and order the inventory records, although no filtered result is shown in this screenshot.

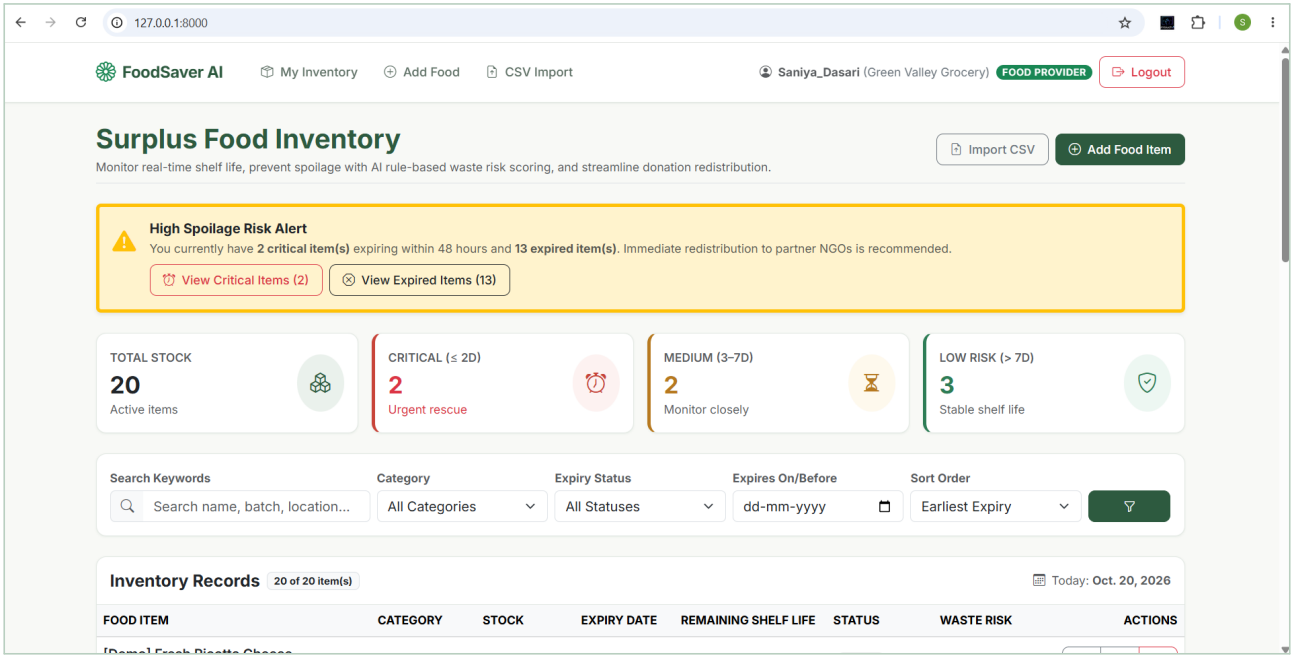

Image 09 — CSV Import Page

The CSV Batch Import page provides a file chooser, an Upload & Process button and a downloadable sample CSV template. A File Format Specifications table lists the required and optional column headers, and a Data Integrity Policy states that invalid rows are skipped and row-level errors are shown after processing, although no file is selected and no upload result appears in this screenshot.
